Genitourinary Cancer Services

RUSH's genitourinary cancer program uses a multidisciplinary team approach to treat cancers of the urinary tract and male reproductive system. Providers use the latest robotic-assisted surgeries, procedures, immunotherapies and reconstruction methods to help patients with genitourinary cancers.

Low-intensity treatment options are available to patients, including a reduced number of chemotherapy cycles and treatment fields for radiation therapy and surgery. These low-impact therapies lead to a more rapid convalescence and a better cosmetic outcome. In addition to these treatments, RUSH providers use targeted therapies to treat metastatic urologic cancers. After therapy, the median survival rate is five years or more.

Patients with prostate cancer can receive compassionate, individualized care at The Coleman Foundation Comprehensive Prostate Cancer Clinic. Treatment options for prostate cancer include active surveillance, biologic therapy, cryotherapy, targeted therapies and focal therapy, one of the latest non-invasive treatment options.

With focal therapy, MRI and real-time ultrasound are used to map the prostate and pinpoint tumors to get the most accurate sample. Once the tumors have been found, the cancerous region of the prostate gland can be destroyed without removing the entire gland.

Conditions We Treat

- Bladder cancer
- Kidney cancer, disease and stones
- Prostatic diseases and neoplasm
- Testicular neoplasm
- Urethral cancer
- Urinary bladder cancer
- Urinary incontinence
- Urogenital cancer

Tests, Treatments and Surgeries

- Brachytherapy
- Chemotherapy
- Clinical trials
- Intraoperative magnetic resonance therapy
- Laparoscopic surgery
- Radiation therapy
- Robotic surgery
